Guidelines for the diagnosis and treatment of chronic lymphocytic leukemia: a report from the International Workshop on Chronic Lymphocytic Leukemia updating the National Cancer Institute–Working Group 1996 guidelines

Michael Hallek, Bruce D. Cheson, Daniel Catovsky, Federico Caligaris-Cappio, Guillaume Dighiero, Hartmut Döhner, Peter Hillmen, Michael J. Keating, Emili Montserrat, Kanti R. Rai and Thomas J. Kipps

blood Prepublished online March 14, 2018;
doi:10.1182/blood-2017-09-806398

Guidelines for diagnosis, indications for treatment, response assessment and supportive management of chronic lymphocytic leukemia

Michael Hallek, Bruce D. Cheson, Daniel Catovsky, Federico Caligaris-Cappio, Guillermo Dighiero, Hartmut Döhner, Peter Hillmen, Michael Keating, Emili Montserrat, Nicholas Chiorazzi, Stephan Stilgenbauer, Kanti R. Rai, John C. Byrd, Barbara Eichhorst, Susan O'Brien, Tadeusz Robak, John F. Seymour and Thomas J. Kipps

The diagnosis of CLL requires the presence of at least 5×10^9 **B-lymphocytes**/L (5000/µL) in the peripheral blood.

The **clonality** of the circulating B lymphocytes needs to be confirmed by **flow cytometry**

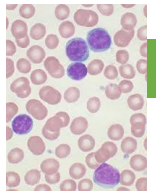
Follow up only by blood test x 1-2/year

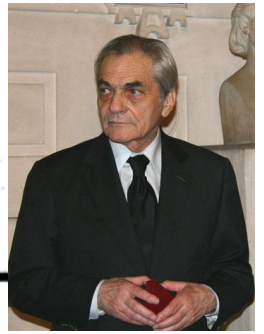


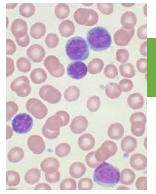
STAGING OF CLL

Staging of B Cell CLL and Relation to Survival

Stage	Clinical Features	Median Survival, years
RAI		
0	Lymphocytosis	12
I	Lymphocytosis + adenopathy	9
II	Lymphocytosis + splenomegaly	7
III	Anemia	1–2
IV	Thrombocytopenia	1–2
BINET		
A	No anemia/thrombocytopenia, <3 involved sites	>10
B	No anemia/thrombocytopenia, >3 involved sites	5
C	Anemia and/or thrombocytopenia	2

Kanti R. Rai, MD

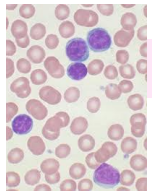




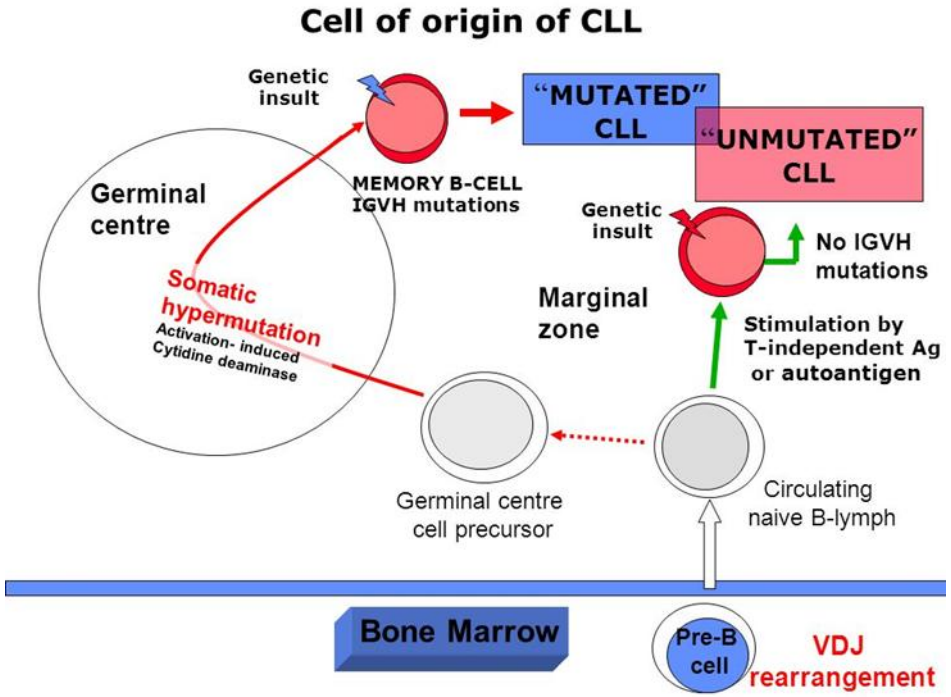
Risk stratification

Risk stratification base on FISH analysis

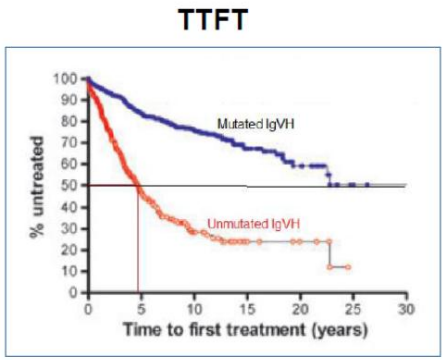
		%	Overall survival
FISH	Deletion 17p	10–7	2-3
	11q Deletion	20	6-8
	Trisomy 12	15	9-11
	Deletion 13q	55	17



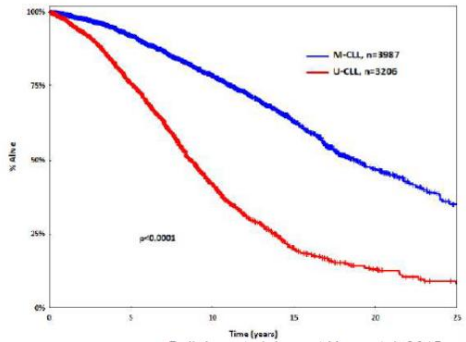
Risk stratification base on mutational status



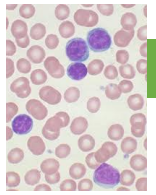
IGHV mutational status in CLL : prognostic value

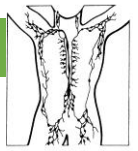


Pepper, BJH, 2011

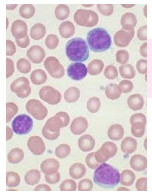


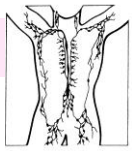
Baliakas et al. Lancet Haematol. 2015





Patients with CLL may have a heterogenous behavior which is mainly related to the biological background and genetic changes that were acquired by the leukemic cells

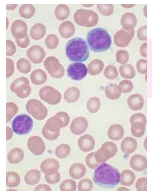


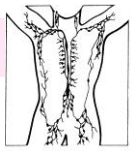


CLL International Prognostic Index (2016)

	Adverse Factor	Grade
Age	>65 years	1
Clinical Stage	Rai I-IV or Binet B-C	1
β_2-microglobulin level	>3.5 mg/L	2
IGHV mutation status	Unmutated (>98% homology with germline)	2
Del(17p) and/or *TP53* mutation	Present	4

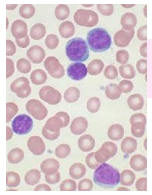
Risk	Score	5-year Overall Survival ($p<0.001$ for all)
Low	0-1	93%
Intermediate	2-3	79%
High	4-6	63%
Very High	7-10	23%

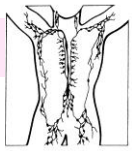




Treatment :

Why not to treat every CLL patient?

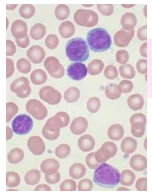


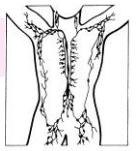


1/3 will never required therapy

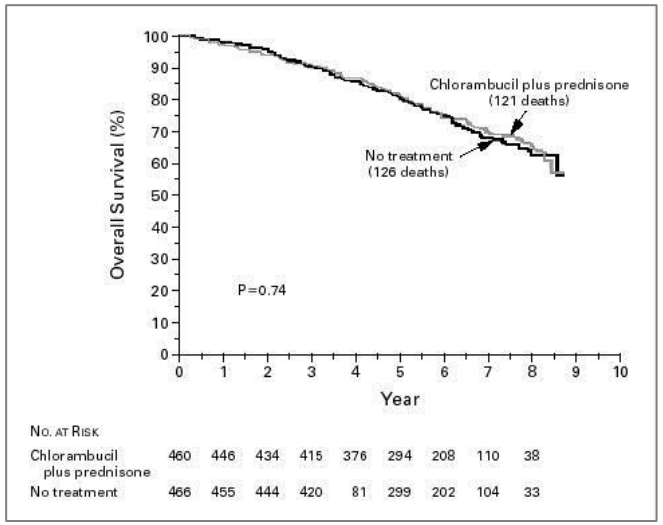
1/3 will required therapy during follow-up

1/3 will required therapy shortly after diagnosis





Dighiero G et al. N Engl J Med 1998



CLL1 HR-Fludarabin (1997-2004)

CLL1 Trial Of The German CLL Study Group (GCLLSG)

Fludarabine or No therapy

No significant difference between both groups in OS was assessed (p= 0.47).

Early Versus Deferred Treatment With Combined Fludarabine, Cyclophosphamide and Rituximab (FCR) Improves Event-Free Survival In Patients With High-Risk Binet Stage A Chronic Lymphocytic Leukemia

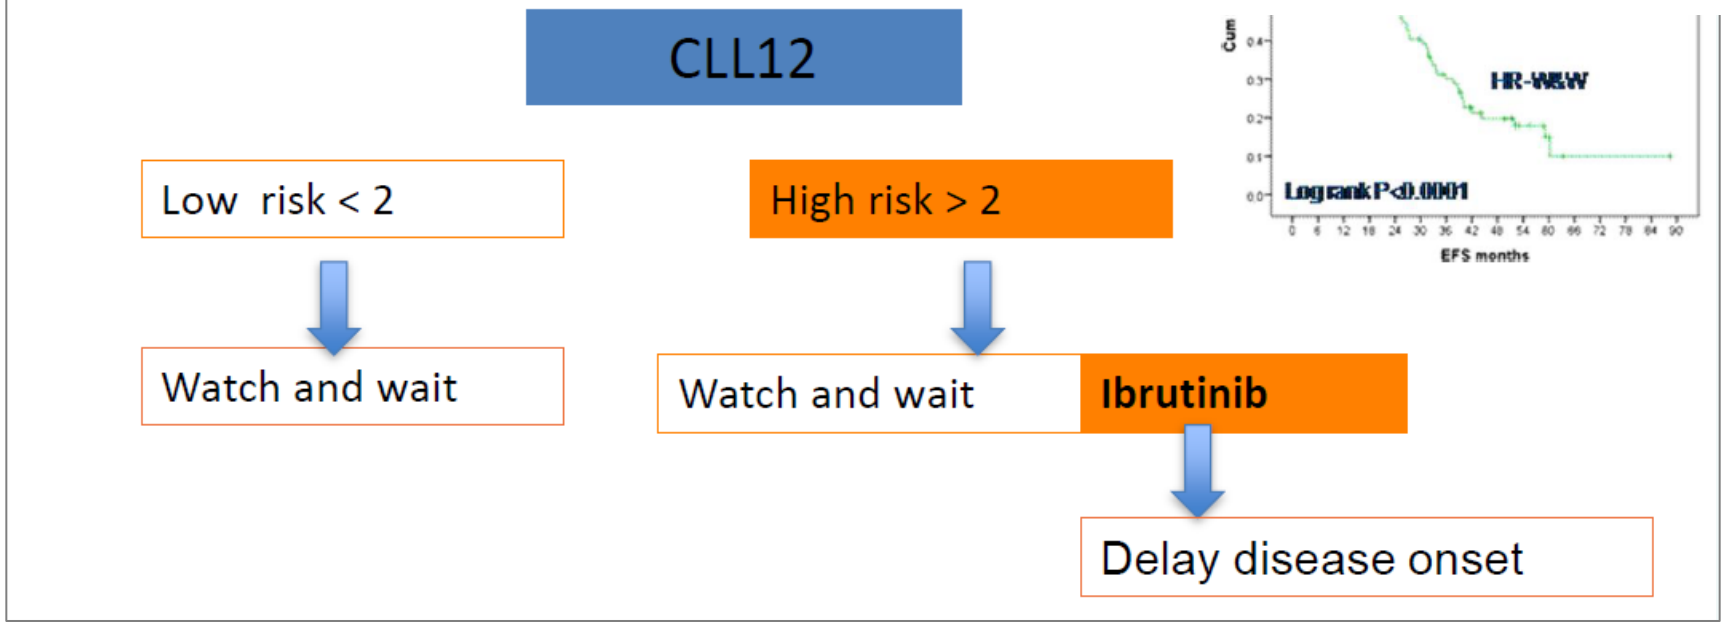
First Results Of a Randomized German-French Cooperative Phase III Trial- CLL7

High risk > 2
200 pts (25.1%)

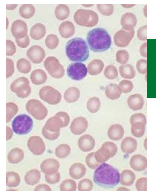
Watch and wait	FCR X 6
101 pts	100 pts (82)

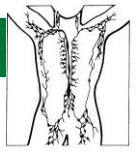
12/2013

- At median follow-up of 49 months, **no benefit in OS.**



Estimated Enrollment:	540
Study Start Date:	April 2014
Estimated Study Completion Date:	April 2022



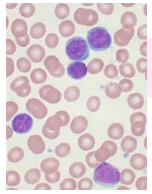


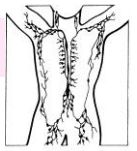
Asymptomatic patients

Binet stage A

Rai stage 0-1

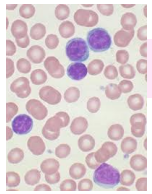
No treatment= follow up by an expert hematologist

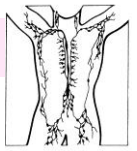




Treatment :

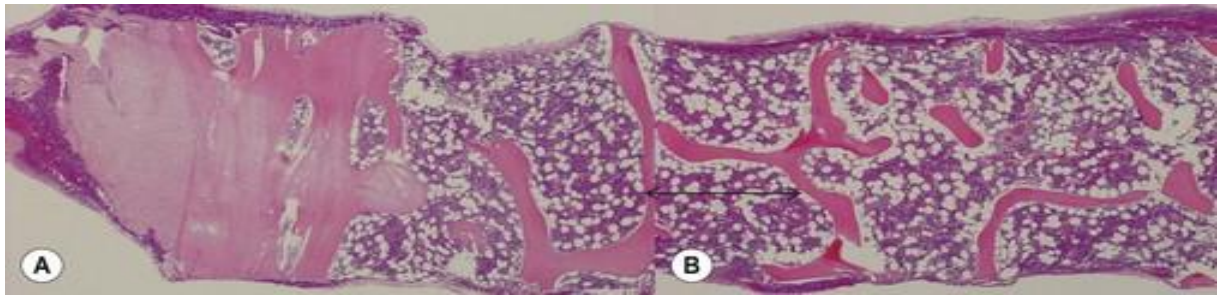
When to start therapy ?

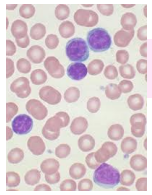


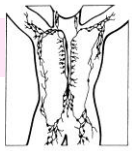


When to treat?

✓=Anemia or thrombocytopenia-progressive BM “insufficiency”

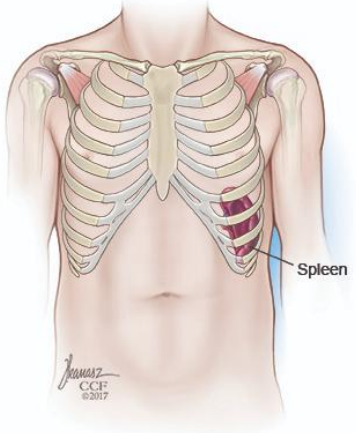


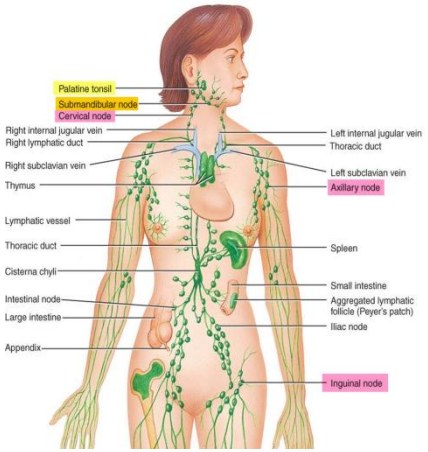


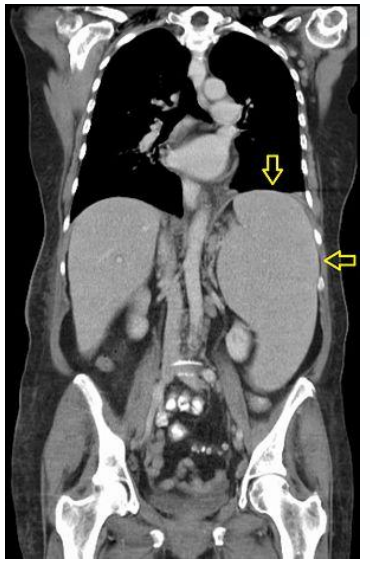


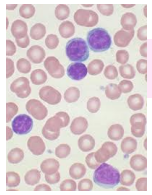
When to treat?

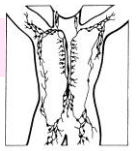
- ✓=Anemia or thrombocytopenia-progressive BM “insufficiency”
- ✓Massive-bulky splenomegaly = 6 cm below the lower costal margin
- ✓Bulky lymphadenopathy or progressive symptomatic lymphadenopathy>10 cm









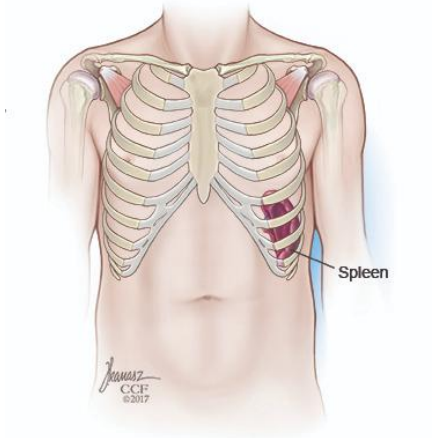


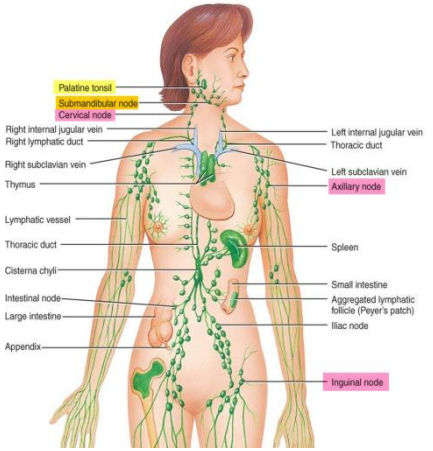
When to treat?

- ✓=Anemia or thrombocytopenia-progressive BM “insufficiency”
- ✓Massive-bulky splenomegaly = 6 cm below the lower costal margin
- ✓Bulky lymphadenopathy or progressive symptomatic lymphadenopathy>10 cm
- ✓Rapid progressive lymphocytosis:

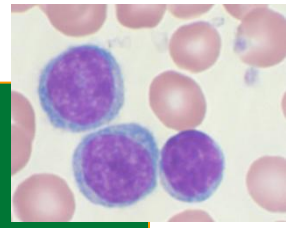
  Increase > 50% in 2 months

  > 100 % in 6 months
- ✓Autoimmune anemia or thrombocytopenia refractory to steroids





Other considerations before we start therapy?



Who is the patient in front of us ?

- Age
- medical history
- medications
- support system

CR = complete response; OR = overall response

Novel agents :

Biological agents ≠ chemotherapy

- Selective – act against specific cell
- Activate the immune system to recognize “leukemia cells” as stranger and attack them
- Less long standing side effects
- less immunesuppressive

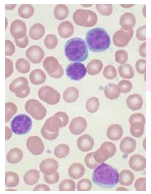
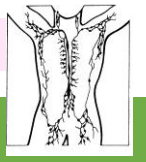
Ibrutinib as Initial Therapy for Patients with Chronic Lymphocytic Leukemia

RESONATE II Investigators-Jan A. Burger ,

N Engl J Med 2015; 373:2425-2437

FDA Approves Imbruvica (ibrutinib) for the First-Line Treatment of Chronic Lymphocytic Leukemia-2016

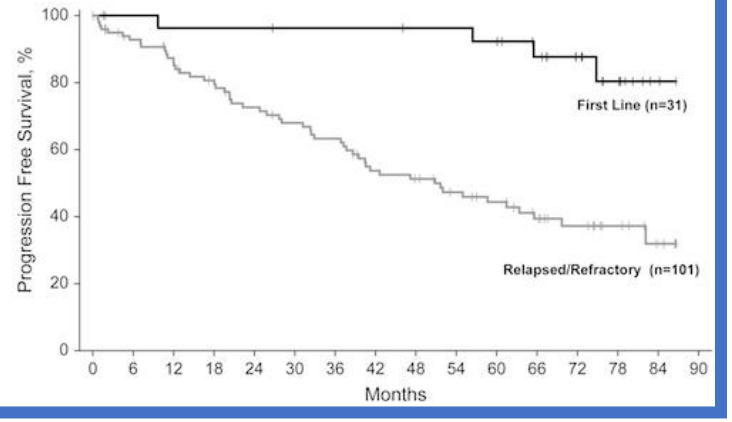




Up to 7 Years of Follow-up of Single-Agent Ibrutinib in the Phase 1b/2 PCYC-1102 Trial of First Line and Relapsed/Refractory Patients with Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma

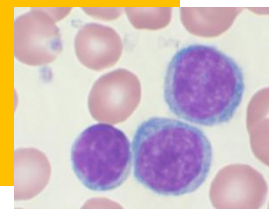
- ORR was 89% for all pts
- **Median DOR was not reached for first line and was 57 mo for R/R pts.**
- Median OS was NR in first line or R/R pts (63, NE),
  with estimated 7 y OS rates of 75% and 52%, respectively.
- Among R/R pts, median PFS trended longer for 27 pts with 1–2 prior lines of therapy (66)
  versus 14 pts with 3 (59) or 60 pts with ≥4 prior lines of therapy (39).
  - PFS

Figure 1. PFS for All-Treated First Line and Relapsed/Refractory Patients with CLL



Outcomes of Ibrutinib-Treated Patients With Chronic Lymphocytic Leukemia/Small Lymphocytic Leukemia With High-Risk Prognostic Factors in an Integrated Analysis of 3 Randomized Phase 3 Studies."

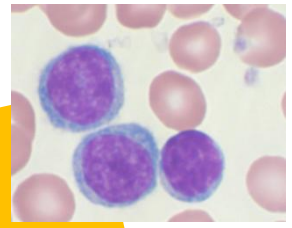
Kipps T. ICML/IwCLL2017



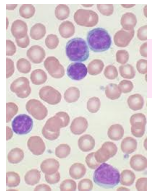
Data from the following trials were pooled
RESONATE (42 months FU),
RESONATE-2 (36 months FU)
HELIOS (32 months FU)

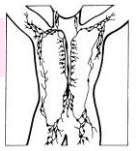
Analyzed based on:
*IGHV mutational status,
*del(11q)
*trisomy 12,
*complex karyotype.
*Impact of del(17p) was not assessed

	IGHV		Trisomy 12		Complex Karyotype		Del 11q	
	Unmut (n=344)	Mut (n-113)	With (n=90)	Without (n=314)	With (n=41)	Without (n=338)	With (n=168)	Without (n=382)
42 months OS%	78	84	82	80	77	78	80	78
Log-rank	0.41		0.92		0.91		0.08	
P value	1.21		1.02		0.96		0.08	



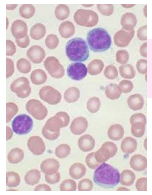
Results suggest that genomic risk factors associated with poor outcomes using traditional therapies have less relevance with ibrutinib treatment

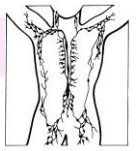




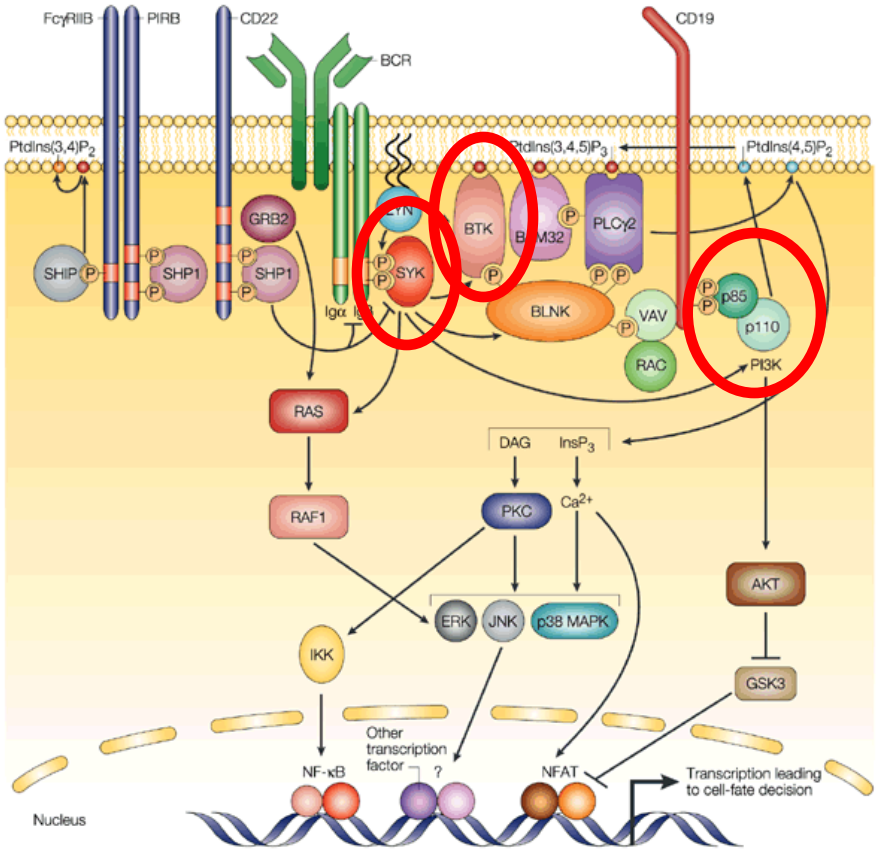
Ibrutinib side effects:

- Diarrhea
- Hypertension
- Invasive fungal infection and other infections
- 7-8 % atrial fibrillation
- Increase bleeding tendency





BCR-associated Kinases: Proven Effective Therapeutic Targets

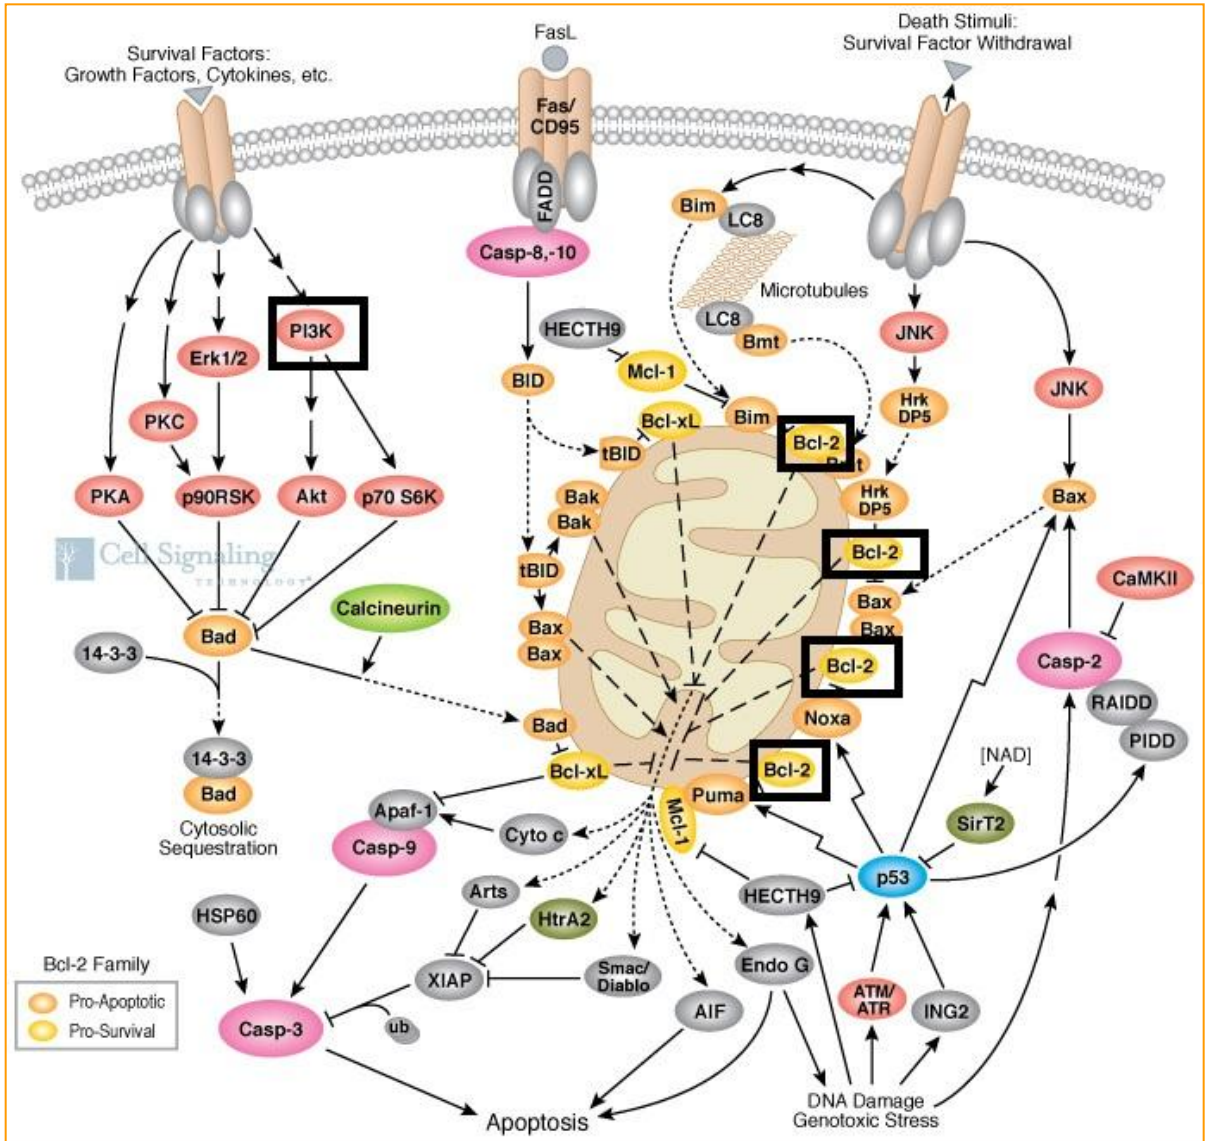


- **Syk (spleen tyrosine kinase):**
  1. **fostamatinib**
  2. **PRT062070**
  3. **GS-9973**
- **Btk (Bruton's tyrosine kinase):**
  1. **ibrutinib**
  2. **CC-292**
  3. **ACP-196**
  4. **ONO-4059**
- **PI3K (phosphatidyl 3-kinase):**
  1. **Idelalisib (GS-1101)**
  2. **Duvelisib (IPI-145)**
  3. **AMG319**

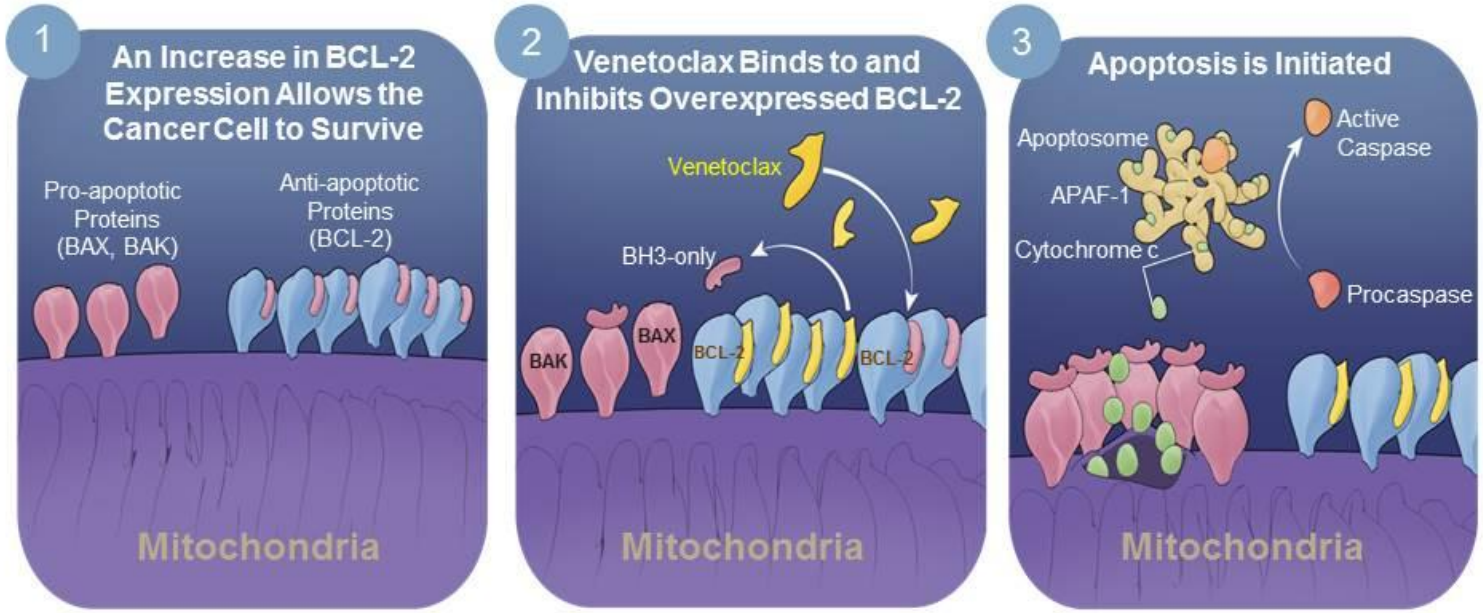
BCL2 INHIBITORS

Proliferation

Apoptosis



Venetoclax: Selective BCL-2 Inhibitor

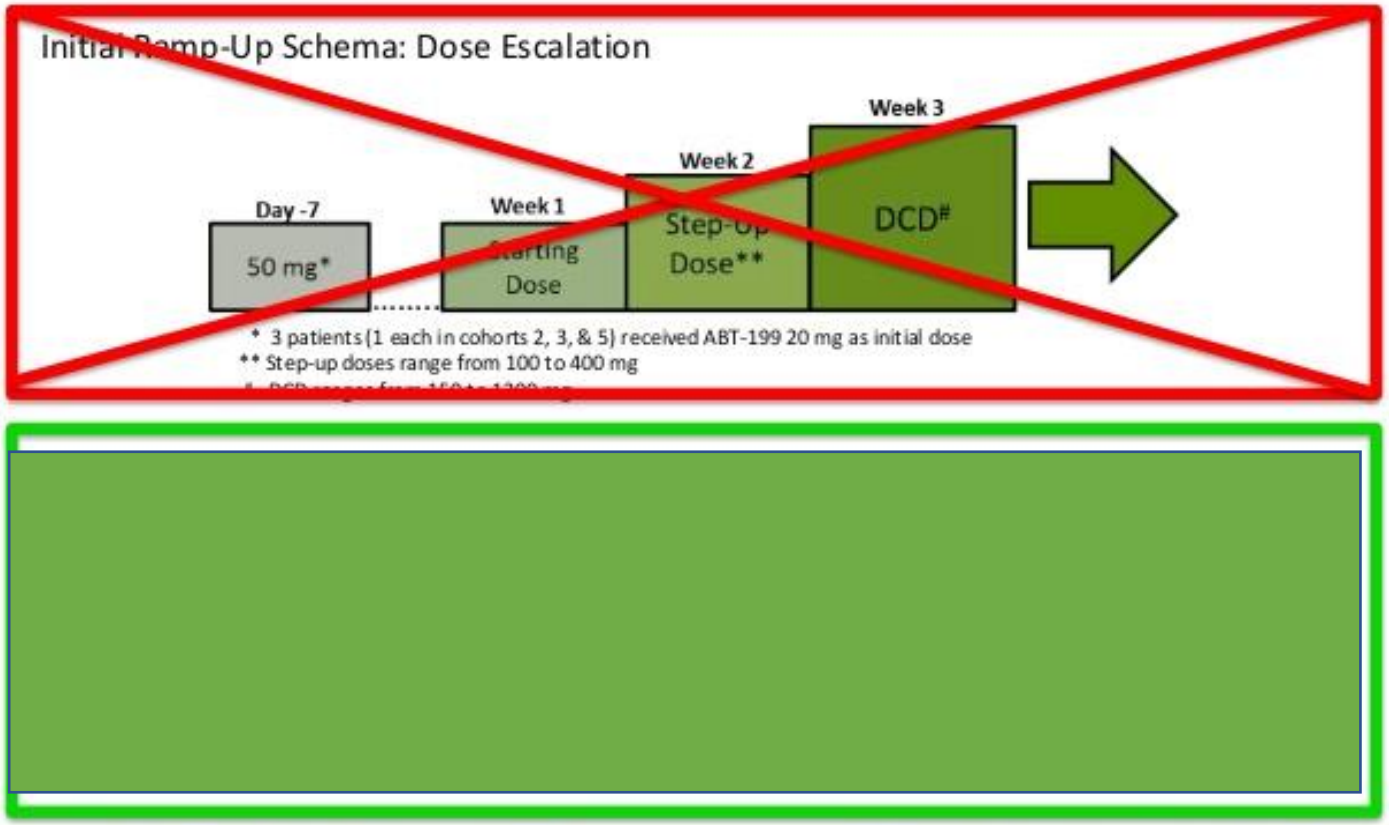


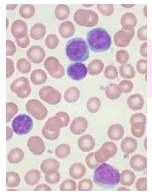
- Venetoclax is a potent, orally bioavailable agent with a BCR-independent mechanism of action and substantial activity in heavily pre-treated CLL (Roberts AW et al, *NEJM* 2015)

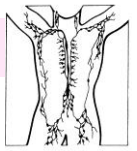
Adapted from Jones et al. Oral Presentation at ASH 2015, Orlando, Florida

ABT-199 (Venetoclax) Dosing Schema

Daily ABT-199 doses increased weekly to the designated cohort dose (DCD)







Venetoclax for Patients With Chronic Lymphocytic Leukemia With 17p Deletion: Results From the Full Population of a Phase II Pivotal Trial.

Venetoclax (VEN) Monotherapy in Relapsed/Refractory (R/R) Chronic Lymphocytic Leukemia (CLL) with Del(17p)

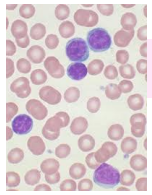
- Phase II study of VEN monotherapy
- N = 107 patients with R/R CLL and del(17p)
- **Primary study endpoint:** Overall response rate (ORR) by independent review committee (IRC)

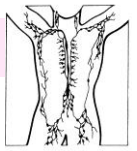
Response (IRC assessed)	N = 107
ORR	79.4%
CR or CRi	7.5%
nPR/PR	72%
Survival rate (12 mo)	
Progression-free survival (PFS)	72%
Overall survival (OS)	86.7%

CR = complete remission; CRi = CR with incomplete bone marrow recovery; nPR = nodular partial remission; PR = partial remission

Stilgenbauer S et al. *Proc ASH* 2015;Abstract LBA-6.

FDA Approves Venetoclax for CLL in Patients With 17p Deletion Who Have Been Treated With at Least One Prior Therapy 2016



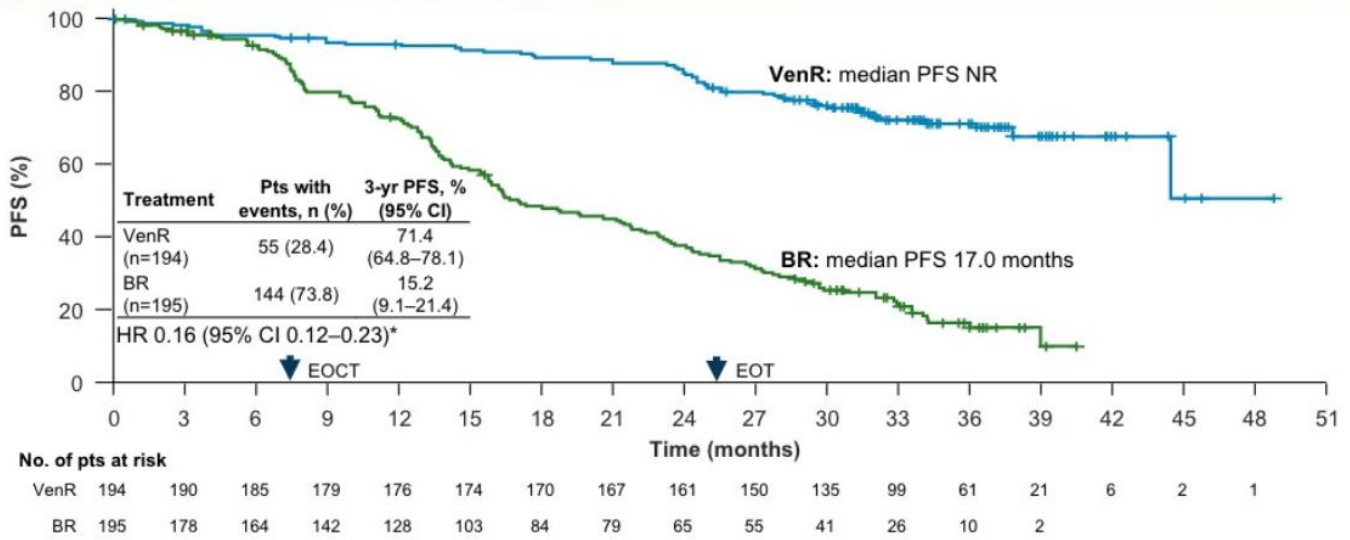


June 8, 2018

FDA Approval of VENCLEXTA® (venetoclax tablets) in Combination with Rituximab as a Fixed Duration Treatment for Chronic Lymphocytic Leukemia or Small Lymphocytic Lymphoma Patients Who Have Received One Prior Therapy

Superior PFS with VenR vs BR maintained with 1 additional year of follow-up: update

Investigator-assessed PFS



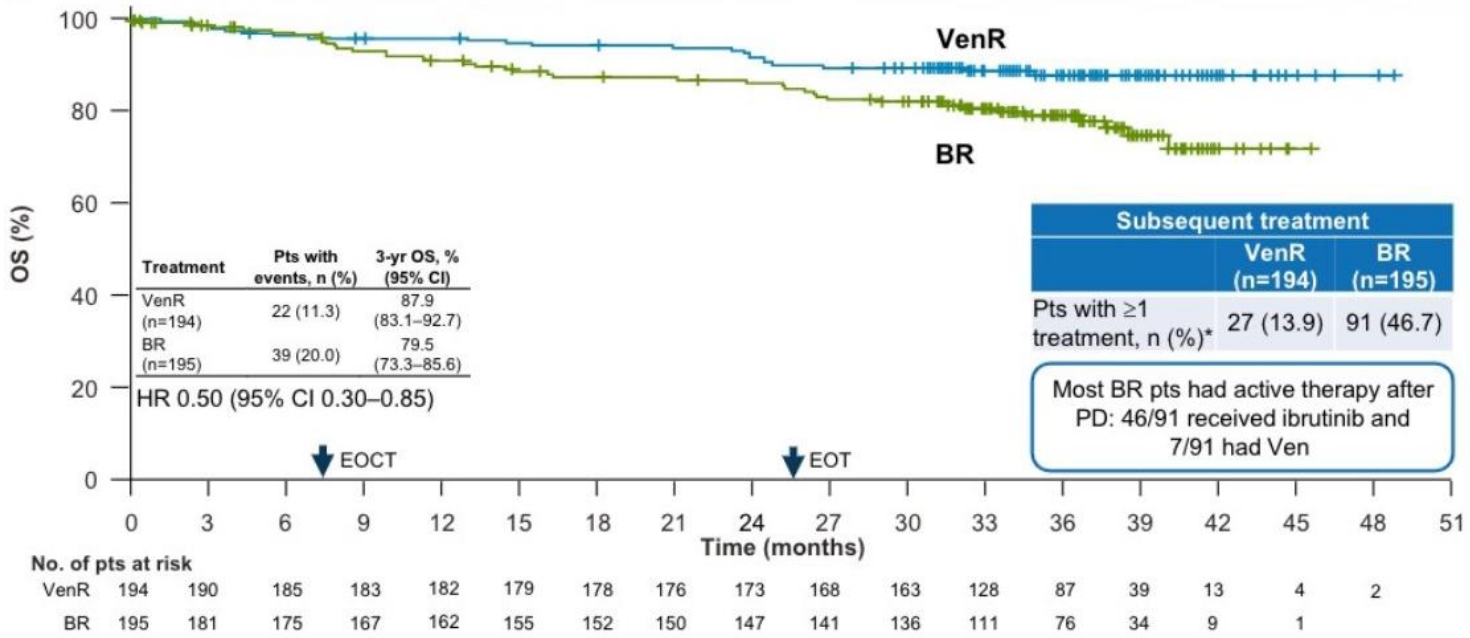
- Median follow-up 36.0 months (range 0.0–48.6); VenR 36.1 months, BR 35.9 months

*Stratified HR

Data cut-off date: May 8, 2018

03/2018

Clinically meaningful improvement in OS with VenR vs BR maintained after 3 years



Treatment	Pts with events, n (%)	3-yr OS, % (95% CI)
VenR (n=194)	22 (11.3)	87.9 (83.1–92.7)
BR (n=195)	39 (20.0)	79.5 (73.3–85.6)

HR 0.50 (95% CI 0.30–0.85)

Subsequent treatment	VenR (n=194)	BR (n=195)
Pts with ≥1 treatment, n (%)*	27 (13.9)	91 (46.7)

Most BR pts had active therapy after PD: 46/91 received ibrutinib and 7/91 had Ven

No. of pts at risk

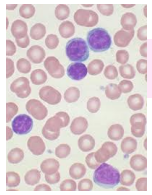
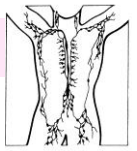
*Unstratified HR 0.51 (95% CI 0.30–0.86)
Median follow-up: 36.0 months (range 0.0–48.6). Median per arm: VenR 36.1 months; BR 35.9 months

Data cut-off date: May 8, 2018





Side effects of venetoclax:

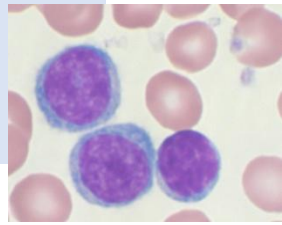
- neutropenia, anemia, thrombocytopenia
- diarrhea, nausea, u
- upper respiratory tract infection,

Serious complications :

- pneumonia,
- tumor lysis syndrome.

Durability of Responses on Continuous Therapy and Following Drug Cessation in Deep Responders with Venetoclax and Rituximab."

Danielle Brander; Duke Cancer Institute IWCLL 2017



49 patients with venetoclax plus rituximab

↓

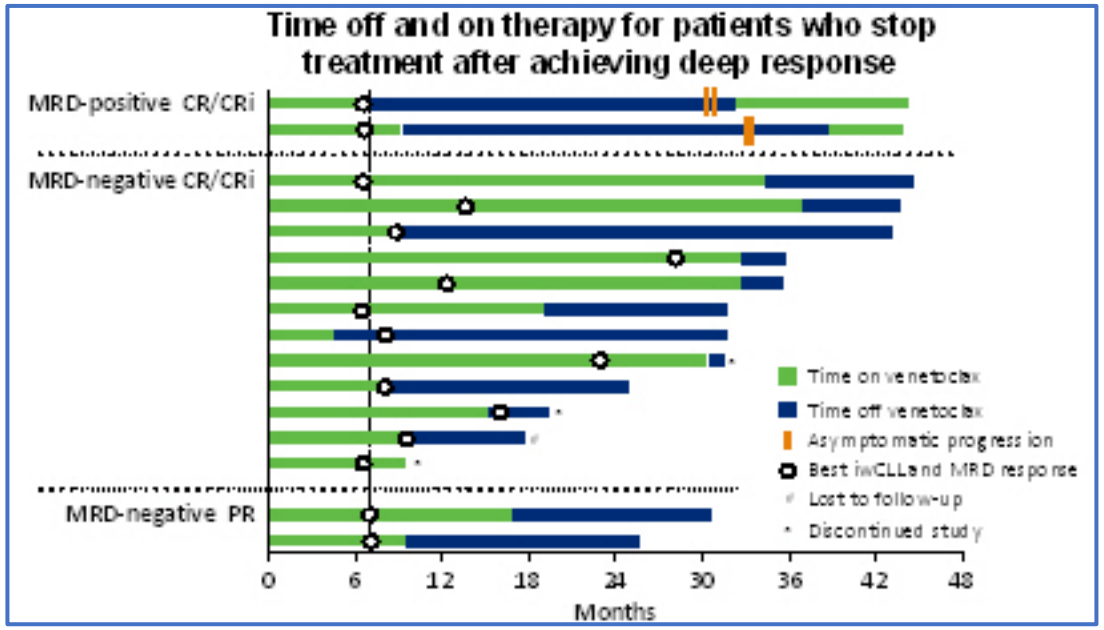
Tx till complete remission (CR) or minimal residual disease (MRD)-achieved

↓

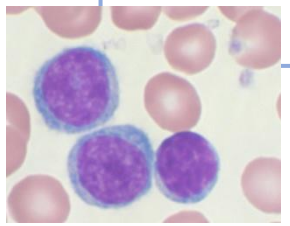
Discontinue venetoclax

↓

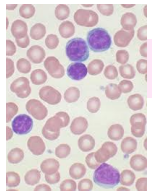
Patients with progressive disease after discontinuation could reinitiate the same combination.

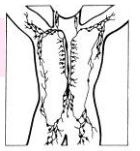


12 Patients had durable remissions after elective treatment cessation (10 ongoing)
None of the patients who achieved MRD-negativity have progressed off therapy (median time 20 months)



Possible to discontinue venetoclax after achieving a deep response and to maintain treatment –free remission

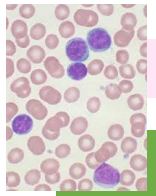


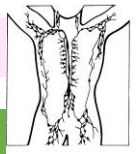


Both Ibrutinib and venetoclax are effective drugs

BUT

Are they more effective than std treatment in newly diagnosed symptomatic CLL patients?





Alliance Study Design

- Multicenter, randomized, double-blind phase III study

Untreated patients with CLL meeting IWCLL 2008 criteria for tx initiation;
- aged ≥ 65 yrs;
- EGOG PS 0-2;
- ANC ≥ 1000 unless due to BM involvement;
- PLT ≥ 30; $CrCl_{CG}$ ≥ 40; AST/ALT ≤ 2.5 x ULN; no heparin or warfarin
(N = 547)

Ibrutinib 420 mg QD (n = 182)	***Until PD***
Ibrutinib 420 mg QD + **Rituximab** 375 mg/m^2 wkly x 4 wks starting cycle 2 Day 1; cycles 3-6 Day 1* (n = 182)	***Ibrutinib until PD***
Bendamustine 90 mg/m^2 on Days 1, 2 + **Rituximab** 375 mg/m^2 on cycle 1 Day 1; 500 mg/m^2 on cycles 2-6 Day 1* (n = 183)	***Crossover to ibrutinib w/n 1 yr of PD allowed***

*28-day cycles.

- Primary endpoint: PFS
  - 2 primary comparisons of ibrutinib vs BR and ibrutinib + R vs BR with 90% power to detect HR of 0.586 (estimated 2-yr PFS rates: ibrutinib, 75%; BR, 61%) and overall 1-sided α = 0.025 for each comparison
  - If both primary comparisons significant, third planned comparison of ibrutinib + R vs ibrutinib

Woyach. ASH 2018. Abstr 6. Woyach. NEJM. 2018;[Epub].

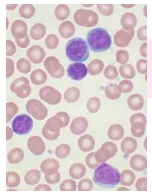
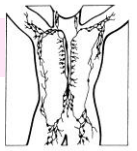
Woyach. ASH 2018. Abstr 6. Woyach. NEJM. 2018;[Epub].

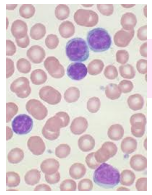


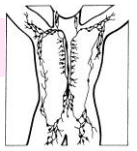


A041202: Conclusions

- In older patients with CLL, first-line ibrutinib ± R significantly prolonged PFS vs BR (both $P < .001$), with no additional PFS benefit with addition of R to ibrutinib
  - Median PFS: ibrutinib, NR; ibrutinib + R, NR; BR, 43 mos
  - 2-yr PFS: ibrutinib, 87%; ibrutinib + R, 88%; BR, 74%
- Ibrutinib associated with important toxicities in this older cohort, with investigators recommending close monitoring with ibrutinib in this setting
  - Significantly higher rates of HTN ($P < .001$) and atrial fibrillation ($P = .05$) with ibrutinib-based tx
  - BR exhibited significantly higher rates of febrile neutropenia ($P < .001$), neutropenia ($P < .001$), and thrombocytopenia ($P = .008$)
- Investigators concluded that further large clinical trials are needed in this patient population (eg, A041702, EA9161), with identification of discontinuation strategies of significant interest

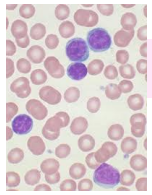
Woyach. ASH 2018. Abstr 6. Woyach. NEJM. 2018;[Epub]. NCT03737981. NCT03701282.

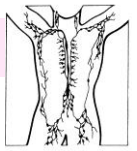




iLLUMINATE: Phase III Trial of Ibrutinib + Obinutuzumab vs Chlorambucil + Obinutuzumab in Previously Untreated CLL/SLL

Moreno. ASH 2018. Abstr 691.
Moreno. Lancet Oncol. 2018;[Epub].



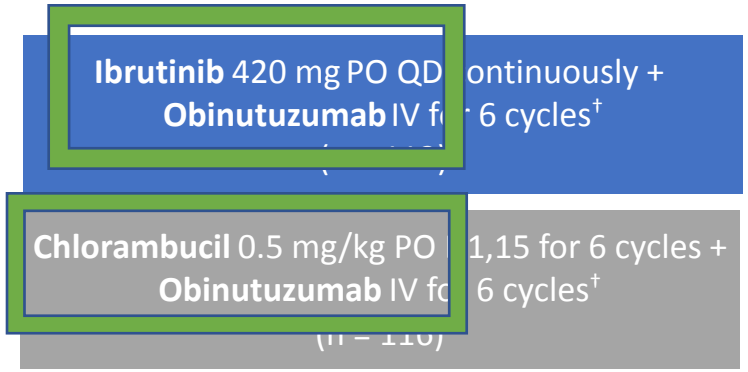


iLLUMINATE: Study Design

- Randomized, open-label, multicenter phase III trial

Stratified by ECOG PS (0-1 vs 2), del(17p)/del(11q) (+/+ vs +/- vs -/+ vs -/-)

Untreated patients with CLL/SLL needing treatment by iwCLL criteria, ≥ 65 yrs
or
< 65 yrs with comorbidities*
(N = 229)



Ibrutinib continued until PD or unacceptable toxicity

If IRC-confirmed progression, crossover to next-line single-agent ibrutinib permitted

*Cumulative Illness Rating Score > 6, creatinine clearance < 70 mL/min, and/or del(17p)/*TP53* mutation.
†Cycle 1: 100 mg, Days 1; 900 mg, Day 2; 1000 mg, Days 8, 15. Cycle 2-6: 1000 mg, Day 1.

- Primary endpoint: PFS by IRC in ITT population
- Secondary endpoints: PFS in high-risk patients (positive for del(17p) or *TP53* mutation, del(11q), or unmutated *IGHV*), MRD, ORR, OS, IRRs, safety

Moreno. ASH 2018. Abstr 691. Moreno. Lancet Oncol. 2018;[Epub].

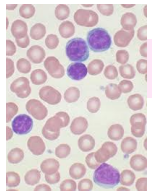
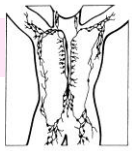
▪ Tumor lysis syndrome, n	--	5
▪ Pyrexia, n	--	4

Moreno. Lancet Oncol. 2018;[Epub].

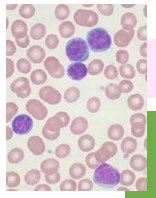
- Deaths due to AEs
  - 10/113 (9%) in ibrutinib arm over median of 2.5 yrs of treatment
  - 2/115 (3%) in chlorambucil arm over median of 5 mos of treatment
- Treatment-related deaths
  - 1 patient with sudden death due to ibrutinib
  - 1 patient with neuroendocrine carcinoma of the skim due to chlorambucil

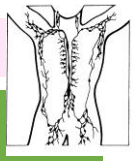




Phase III E1912: First-line Ibrutinib + Rituximab vs Standard-of-Care FCR in Younger Patients With Previously Untreated CLL

Shanafelt. ASH 2018. Abstr LBA-4. NCT02048813.





E1912: Study Design

- Primary analysis of randomized, open-label phase III trial (data cutoff: October 24, 2018)

Stratified by age (< vs ≥ 60 yrs), ECOG PS (0/1 vs 2), stage (III-IV vs I-II), del(11q22.3) vs other

Patients with previously untreated CLL requiring treatment per IWCLL 2008, aged ≤ 70 yrs, ECOG PS 0-2, CrCl > 40 mL/min, ability to tolerate FCR, no del(17p) by FISH (N = 529)

2 → **Ibrutinib** 420 mg PO QD for cycles 1-7 + **Rituximab** 50 mg/m^2 IV on Day 1, cycle 2, then 325 mg/mg^2 on Day 2, cycle 2, then 500 mg/m^2 on Day 1, cycles 3-7 (n = 354)

1 → **Fludarabine** 25 mg/m^2 IV on Days 1-3 for cycles 1-6 + **Cyclophosphamide** 250 mg/m^2 IV on Days 1-3 for cycles 1-6 + **Rituximab** 50 mg/m^2 IV on Day 1, cycle 1, then 325 mg/mg^2 on Day 2, cycle 1, then 500 mg/m^2 on Day 1, cycles 2-6 (n = 175)

Ibrutinib maintenance until PD

28-day cycles.

- Primary endpoint: PFS
  - Study has 80% power to detect PFS HR for ibrutinib + R vs FCR of 0.67 using stratified log-rank test, with prespecified boundary of 2.87 for first PFS interim analysis corresponding to 1-sided *P* = .0025
- Secondary endpoints: OS, safety

Shanafelt. ASH 2018. Abstr LBA-4. NCT02048813.

E1912: Baseline Characteristics

Characteristic, %	Ibrutinib + R (n = 354)	FCR (n = 175)
Median age, yrs	58	57
Age ≥ 60 yrs	41.0	40.0
Female	33.3	31.4
ECOG PS of 0	63.8	62.3
Rai stage		
▪ 0	3.1	5.1
▪ I-II	52.8	53.7
▪ III-IV	44.1	41.1
FISH analysis		
▪ del(11q)	22.0	22.3
▪ Trisomy 12	19.8	15.4
▪ del(13q)	34.2	33.1
> 3.5 mg/L	51.9	48.0
Unmutated *IGHV**	75.0	61.7

*Assessed in 437 patients (82%).

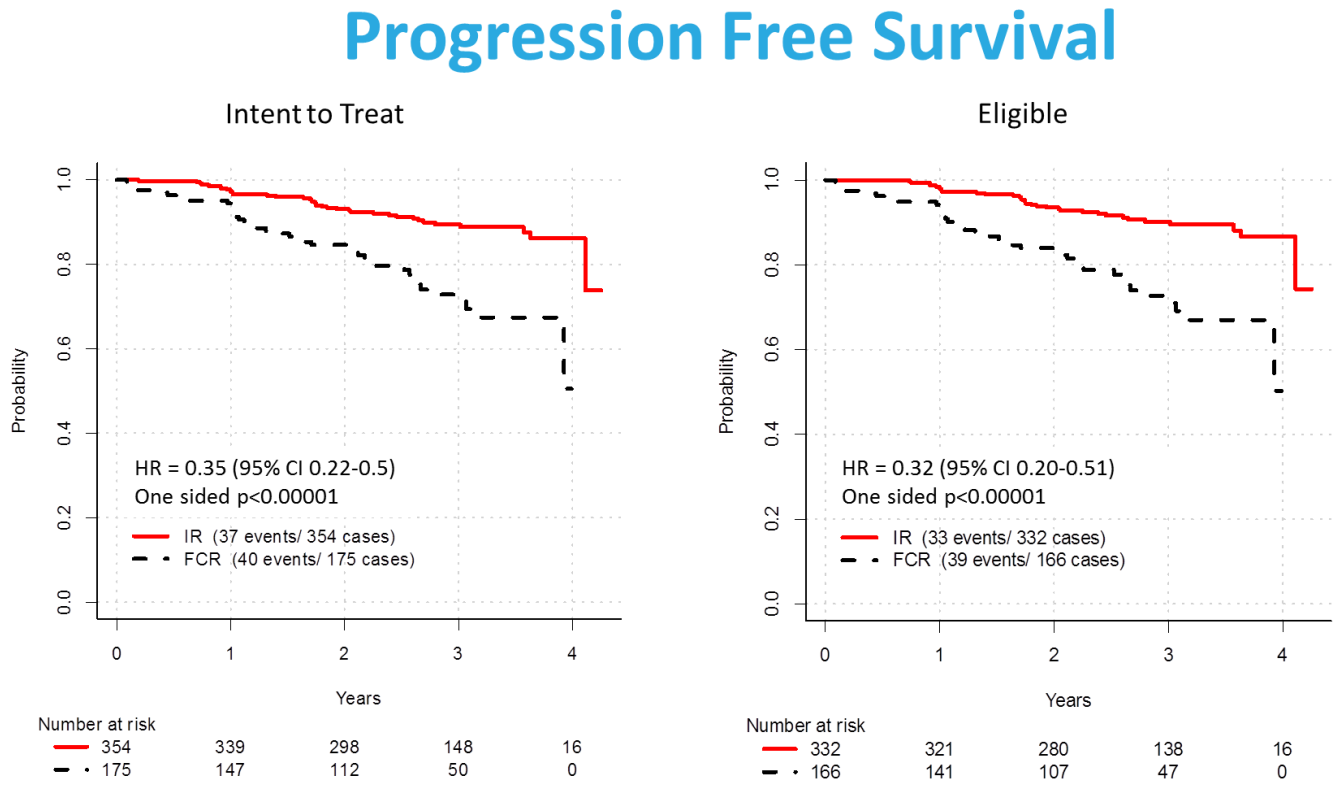
2. ECOG-ACRIN E1912



ASH 2018, Tait D. Shanafelt, MD et al., LBA-4 A Randomized Phase III Study of Ibrutinib (PCI-32765)-Based Therapy Vs. Standard Fludarabine, Cyclophosphamide, and Rituximab (FCR) Chemoimmunotherapy in Untreated Younger Patients with Chronic Lymphocytic Leukemia (CLL): A Trial of the ECOG-ACRIN Cancer Research Group (E1912)

E1912: Grade 3-5 Treatment-Related AEs Throughout Observation

Grade 3-5 Treatment-Related AE Throughout Observation, %	Ibrutinib + R (n = 352)	FCR (n = 158)	*P* Value
Any grade ≥ 3 AE	58.5	72.1	.004
Neutropenia	22.7	43.7	< .001
Anemia	2.6	12.0	< .001
Thrombocytopenia	2.9	13.9	< .001
Any infection	7.1	19.0	< .001
▪ Infection	5.4	8.2	.24
▪ Neutropenic fever	2.3	15.8	< .001
Atrial fibrillation	2.9	0.0	.04
Bleeding	1.1	0.0	.32
Hypertension	7.4	1.9	.01
Diarrhea	2.6	0.6	.19

- With ibrutinib + R vs FCR, significantly higher rates of AF, HTN (both $P < .05$); significantly lower rates of grade ≥ 3 AEs, myelosuppression, any infection, neutropenic fever (all $P \leq .004$)

Shanafelt. ASH 2018. Abstr LBA-4.

E1912: Conclusions

- In this primary analysis of a phase III trial, first-line ibrutinib + R showed statistically significant improvement in PFS and OS vs standard-of-care FCR in younger patients with previously untreated CLL (all $P \leq .00003$)
  - HR for PFS in ITT population: 0.35 (95% CI: 0.22-0.50)
  - HR for OS in ITT population: 0.17 (95% CI: 0.05-0.54)
- Ibrutinib + R was well tolerated in this younger patient population
  - Rate of grade ≥ 3 AEs was 58.5% with ibrutinib + R vs 72.1% with FCR ($P = .004$)
  - With ibrutinib + R vs FCR, low but still significantly higher rates of atrial fibrillation (2.9% vs 0%; $P = .04$) and hypertension (7.4% vs 1.9%; $P = .01$)
- Study investigators proposed evaluating need for indefinite treatment in future studies of novel combination therapy
  - Phase III trials assessing ibrutinib + obinutuzumab ± venetoclax in adults: adults aged < 70 yrs, EA9161 (NCT03701282); adults aged ≥ 70 yrs, A041702 (NCT03737981)

Shanafelt. ASH 2018. Abstr LBA-4.

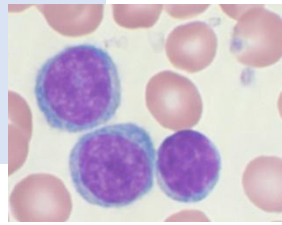
Results suggest that genomic risk factors associated with poor outcomes using traditional therapies have less relevance with ibrutinib treatment

Durability of Responses on Continuous Therapy and Following Drug Cessation in Deep Responders with Venetoclax and Rituximab."

Danielle Brander; Duke Cancer Institute IWCLL 2017



49 patients with venetoclax plus rituximab

↓

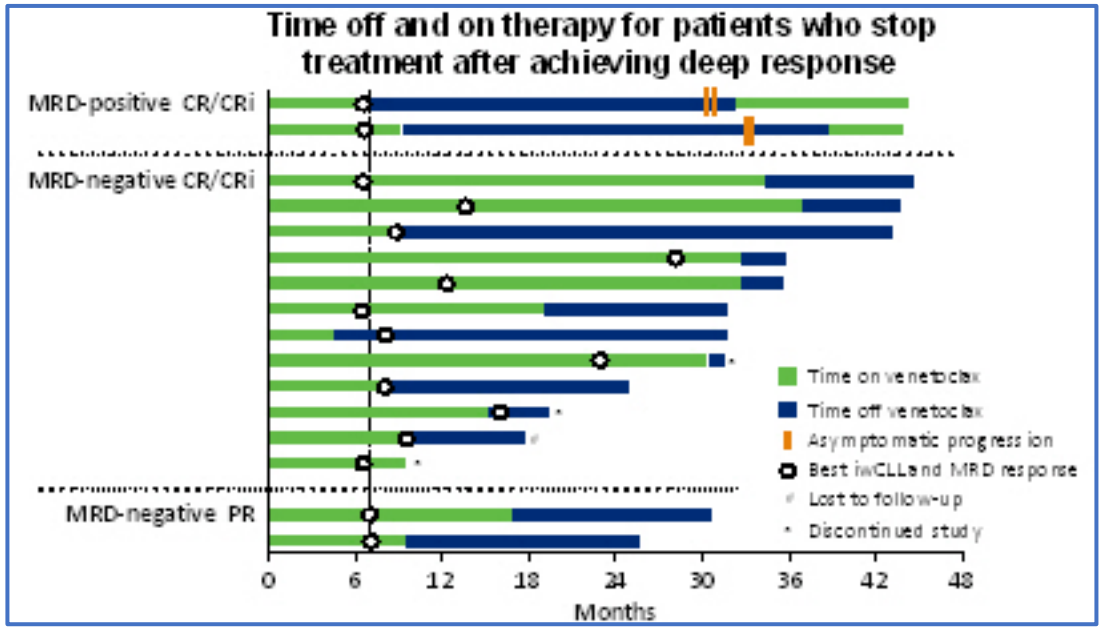
Tx till complete remission (CR) or minimal residual disease (MRD)-achieved

↓

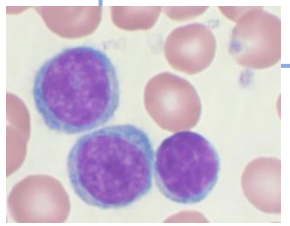
Discontinue venetoclax

↓

Patients with progressive disease after discontinuation could reinitiate the same combination.



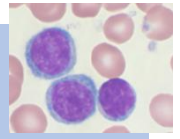
12 Patients had durable remissions after elective treatment cessation (10 ongoing)
None of the patients who achieved MRD-negativity have progressed off therapy (median time 20 months)

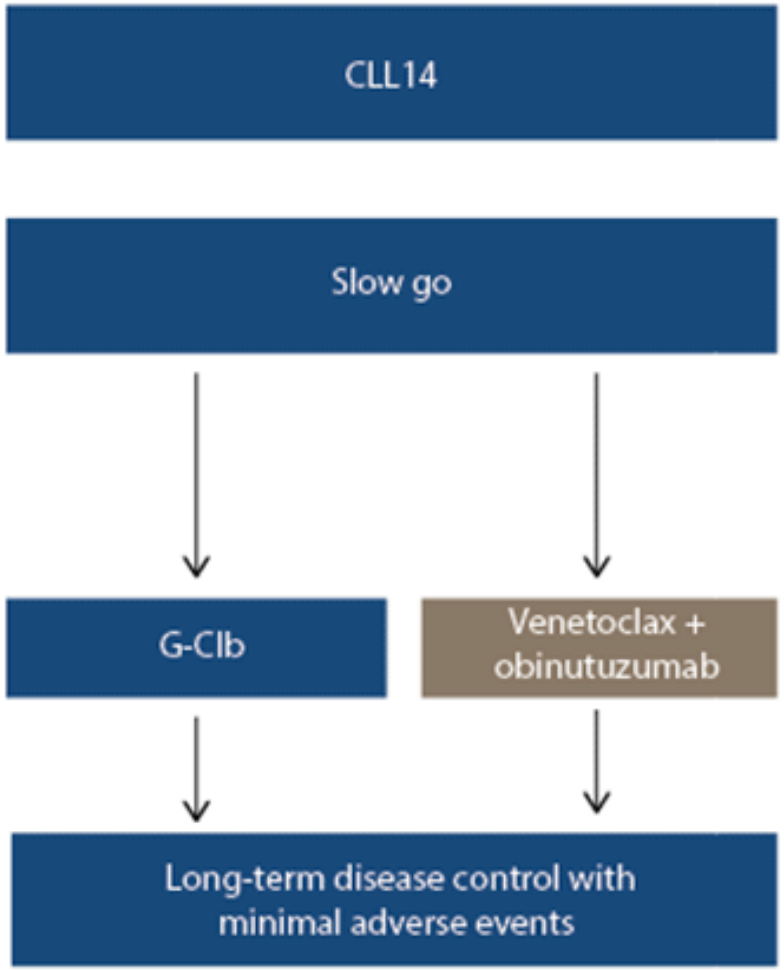


Possible to discontinue venetoclax after achieving a deep response and to maintain treatment –free remission

CLL14: (the successor trial to CLL11)

A Prospective, Open-Label, Multicenter Randomized Phase III Trial to Compare the Efficacy and Safety of Obinutuzumab and Venetoclax with Obinutuzumab and Chlorambucil in Patients with Previously Untreated CLL / *Kirsten Fischer*





- **12 previously untreated patients** with coexisting medical conditions assessed by cumulative illness rating scale (**CIRS) total score > 6** and/or estimated creatinine clearance (CrCl) < 70 mL/min requiring treatment

STUDY DESIGN:

- All patients received **6 cycles of obinutuzumab and venetoclax** followed by **6 additional cycles of venetoclax**.
- Obinutuzumab was administered intravenously with 100 mg on day 1, 900 mg on day 2 (option to deliver 1000 mg on day 1), 1000 mg on day 8 and day 15 of cycle 1 and 1000 mg on day1 for cycles 2-6.
- A gradual weekly dose ramp-up of venetoclax with 20 mg, 50 mg, 100 mg, 200 mg up to 400 mg was administered **starting at day 22** of cycle 1

- Two patients developed laboratory TLS
- None of the protocol defined stopping criteria for the safety run-in phase of the study were met.
- Neither event resulted in interruption or dose modification of study treatment.
- Rapid reduction in the peripheral lymphocyte count was observed in all 12 patients treated with the combination regimen

- **The randomized phase of the CLL14 trial ended in Aug 2016**

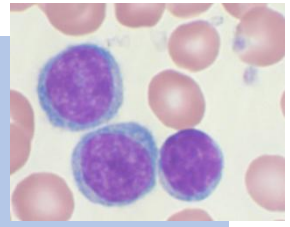
Conclusion:

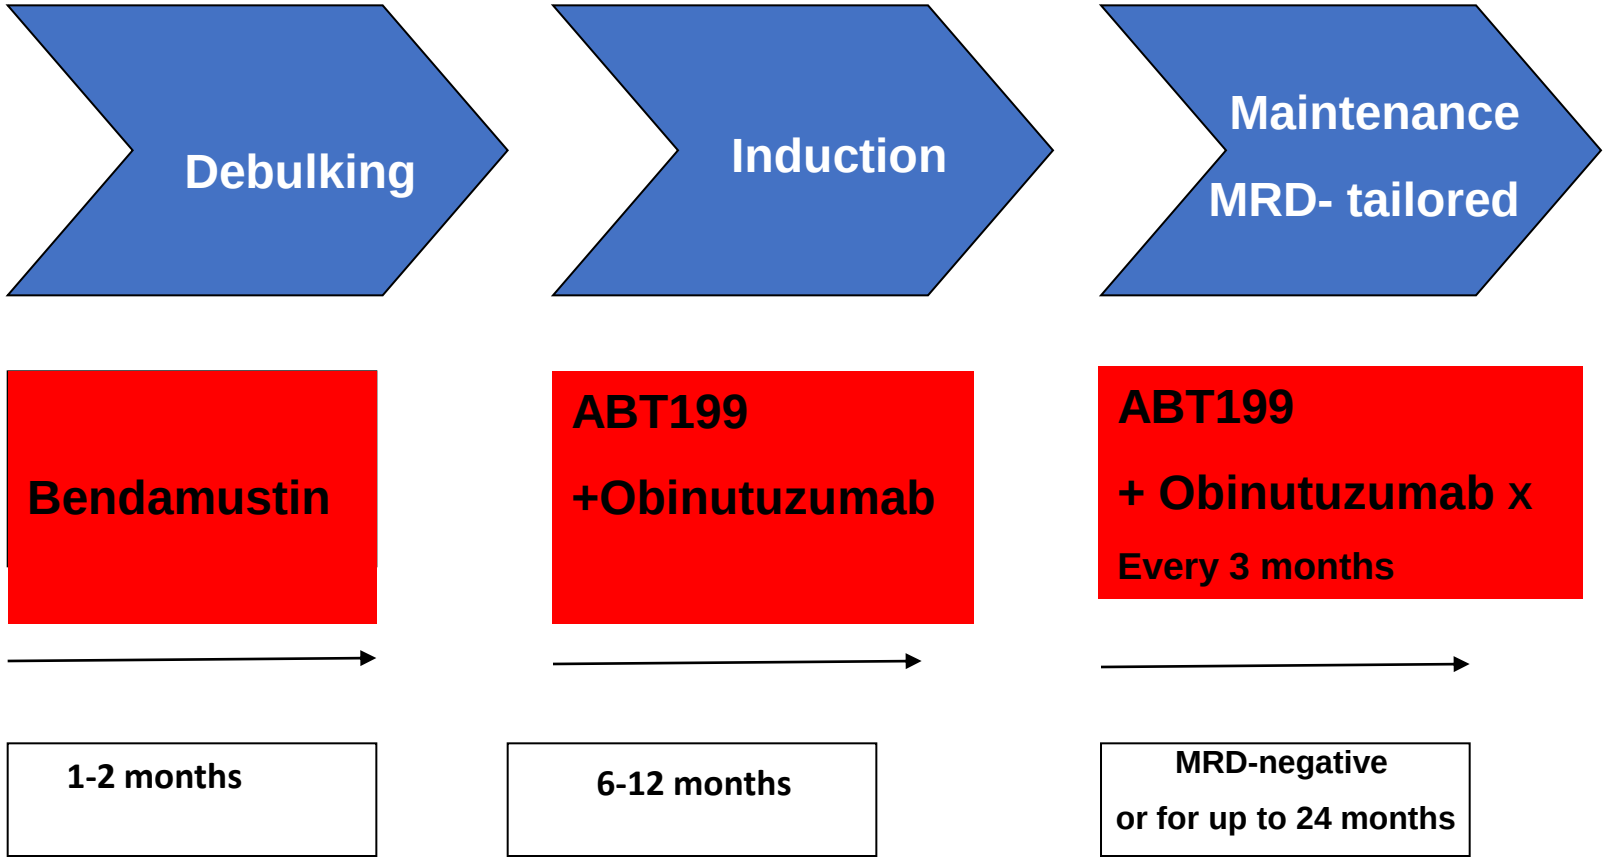
These preliminary data suggest that VEN + G can be safely administered in pts with CLL with no difference in tolerability between R/R and TN subgroups.

A phase 3 study evaluating VEN+G is ongoing.

BAG trial of GCLLSG/sequential triple-T”

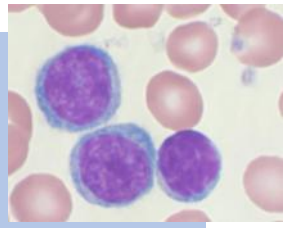
Paula Cramer/EHA-1233





BAG trial of GCLLSG/sequential triple-T”

EHA-1233



- 66 pts were enrolled; 34 pts were treatment-naïve and 29 had R/R CLL (median number of prior therapies: 2, range: 1-8).
- Median age was 59 (28-77)years
- Median CIRS score was 2 (0-14)
- 11 of 59 pts (19%) had a del(17p) and 45 of 61 (74%) had an unmutated IGHV status.

Results:

- 60 pts completed 6 induction cycles with G and A.
- All TN (100%) and all but two of the R/R pts (93%) responded with an ORR of 97% at the end of induction
- MRD negativity ($<10^{-4}$ by flow cytometry) in peripheral blood (pb) was achieved in 56 pts (89%);

Conclusion:

Very efficacious in a heterogeneous study population and well tolerated except

for 3 fatal septicaemias in R/R pts.

A041202: Study Design

- Multicenter, randomized, double-blind phase III study (data cutoff: October 4, 2018)

Stratified by Rai stage (high vs intermediate risk), del(11q22.3) or del(17p13.1) (presence vs absence), ZAP-70 methylation (< vs ≥ 20%)

Untreated patients with CLL meeting IWCLL 2008 criteria for tx initiation; aged ≥ 65 yrs; EGOG PS 0-2; ANC ≥ 1000 unless due to BM involvement; PLT ≥ 30; $CrCl_{CG}$ ≥ 40; AST/ALT ≤ 2.5 x ULN; no heparin or warfarin (N = 547)

Ibrutinib 420 mg QD (n = 182)	***Until PD***
Ibrutinib 420 mg QD + **Rituximab** 375 mg/m^2 wkly x 4 wks starting cycle 2 Day 1; cycles 3-6 Day 1* (n = 182)	***Ibrutinib until PD***
Bendamustine 90 mg/m^2 on Days 1, 2 + **Rituximab** 375 mg/m^2 on cycle 1 Day 1; 500 mg/m^2 on cycles 2-6 Day 1* (n = 183)	***Crossover to ibrutinib w/n 1 yr of PD allowed***

*28-day cycles.

- Primary endpoint: PFS
  - 2 primary comparisons of ibrutinib vs BR and ibrutinib + R vs BR with 90% power to detect HR of 0.586 (estimated 2-yr PFS rates: ibrutinib, 75%; BR, 61%) and overall 1-sided α = 0.025 for each comparison
  - If both primary comparisons significant, third planned comparison of ibrutinib + R vs ibrutinib
